# Network Segmentation

# Segmentation

---

- **Main Purpose:** Enables ZTNA across multi-region and multicloud, including on-premises environment
- Group VNets/VPCs/VCNs/Apps with similar security policies
- Define your own domains
- Use Cases
  - Compliance
  - Governance
  - Audits

# Multicloud Network Segmentation

Aviatrix  
CoPilot

Network Domains

# Multicloud Network Segmentation

## Policy Based Network Segmentation

- Global
- Consistent / Repeatable
- Across accounts, subscriptions & projects

## Cloud and Connection Agnostic

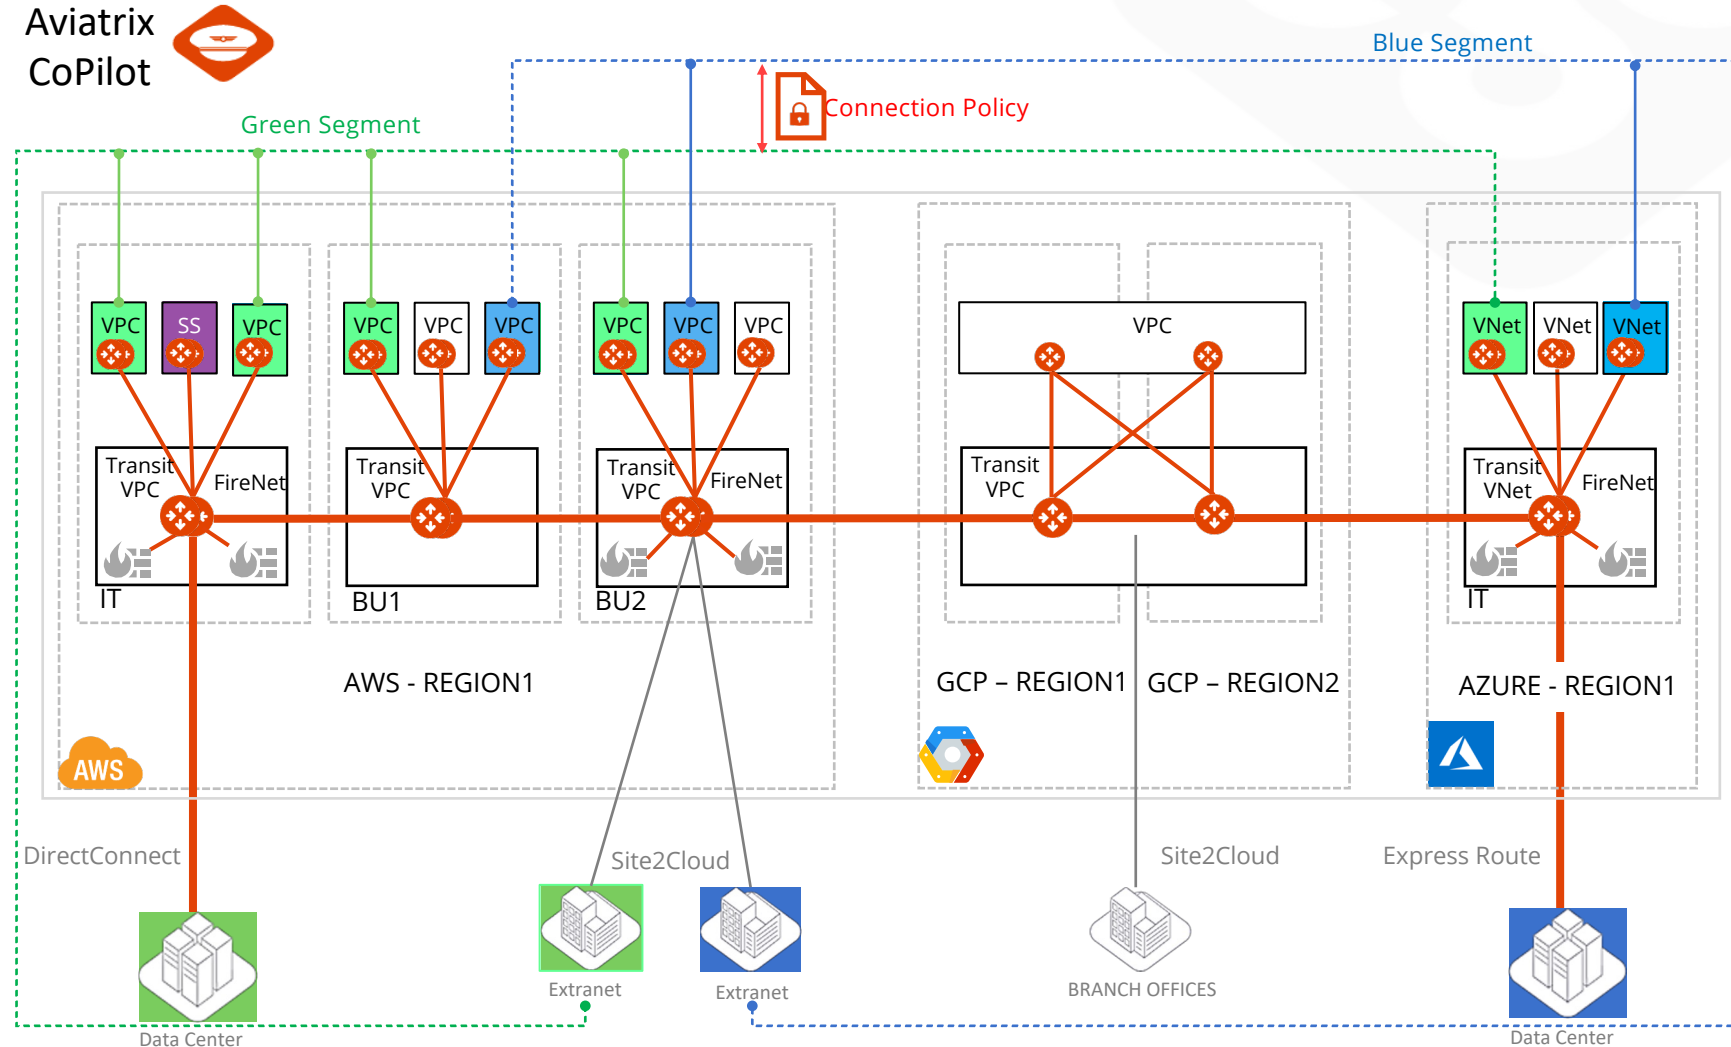

- Single cloud
- Intra-region or inter-region
- Multiple clouds

## Edge/Access Segmentation

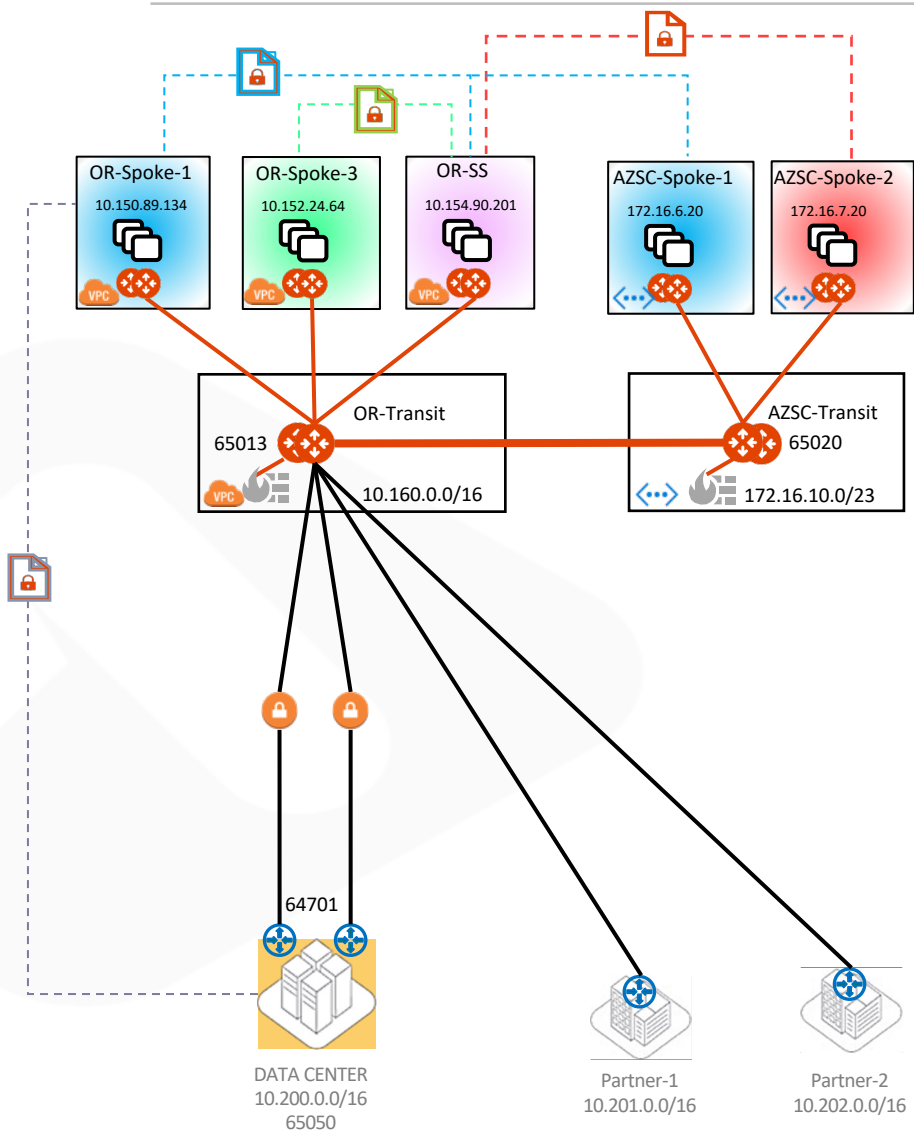

- On-Prem DCs
- Branches
- Extranets
- Cloud Peering

## On-Demand Compliance/Governance

- Security Posture within minutes
- Aviatrix control plane realizes the intent
- Zero-Trust
- Flexible
- Automated

# Multicloud Network Segmentation

# 1. Enabling Transit Gateways for Network Segmentation

## Enable the Network Segmentation:

- Choose the Transit Gateway(s) that will route traffic for its members.

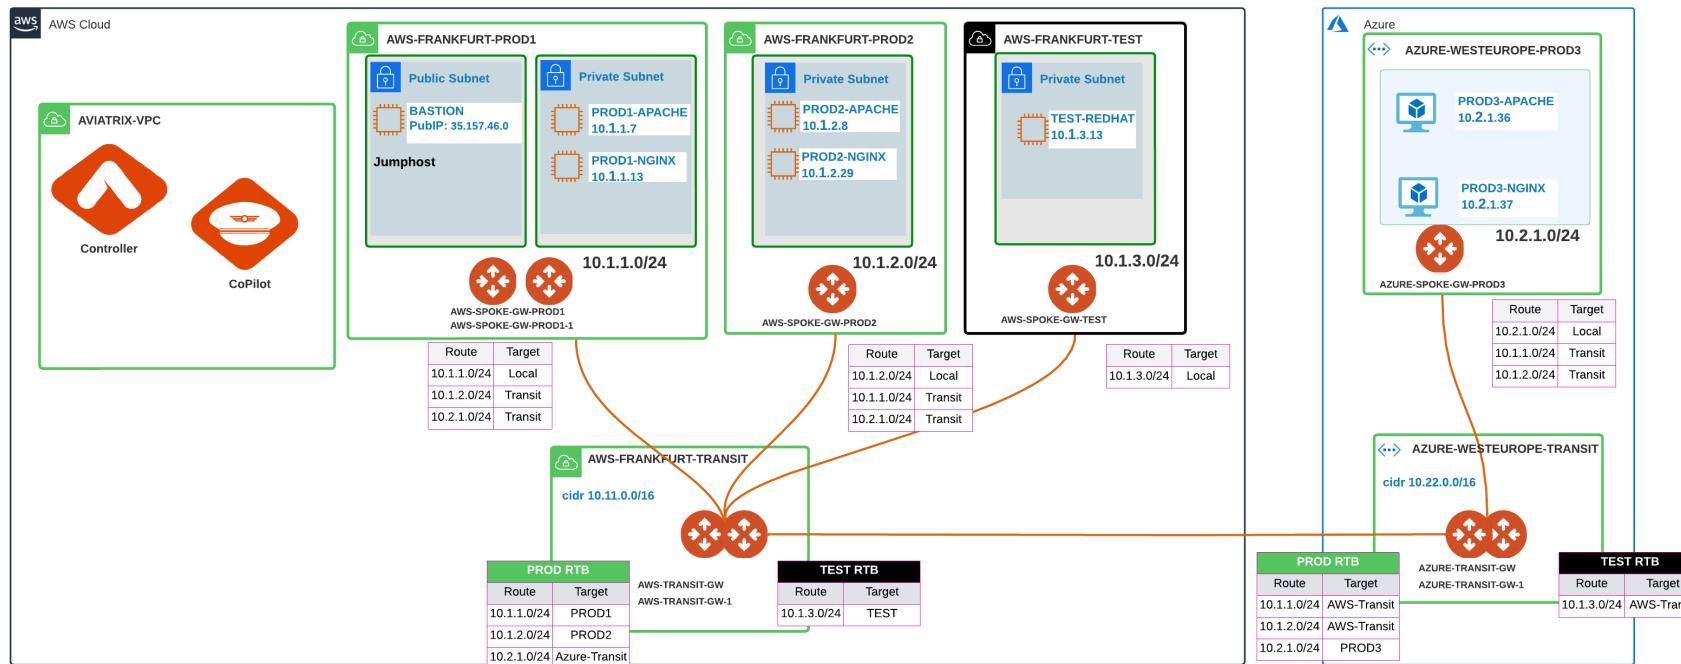

## Configure Transit Gateways for Network Segmentation

Aviatrix transit gateways have to be enabled to support network segmentation on them.

Name	Cloud	Region	IP Address Space	
AWS-TRANSIT-GW	aws	eu-central-1	10.11.0.0/16	<input checked="" type="checkbox"/> Enabled
AZURE-TRANSIT-GW	arm	West Europe	10.22.0.0/16	<input checked="" type="checkbox"/> Enabled

## 2. Creating and Associating a Network Domain

### Transit Gateway

- Multiple RTBs (per each Network Domain)
- Main RTB:
  - The main RTB will host the Transit Routes (i.e. the routes of the *backbone layer*) and the routes that belong to *Unmanaged Network Domains* (i.e. VPCs/Vnets not assigned to any Network Domains yet).

### Spoke Gateway

- Single RTB (Main)

### Create the Network Domains:

- Assign a Name to each Network Domain
- Associate the Spoke VPCs/Vnets and/or Site2Cloud Connections to the Network Domain

**CAVEAT:** A network-domain name can only have letters, digits, a hyphen (-), and an underscore (\_). The name must start with a letter and must have 2-27 characters. For example, **Dev\_Domain**.

Create Network Domain

AWS-FRANKFURT-TEST x

# 3. Apply the Connection Policy (optional)

Optionally, enable the Connection Policy:

- Network Domains' routing tables are merged (i.e. *vrf leaking*).

Edit Network Domain: PROD
