

Operational Best Practices

ACE Team

CoPilot Remote Syslog

- The Syslog server is by default the CoPilot.
 - ❑ When you deploy the CoPilot, automatically the Controller will open the port UDP **5000** (Syslog) on the Security Group attached to the CoPilot instance.
 - ❑ Aviatrix CoPilot Remote Syslog Profile is set to use the Profile **9**.

Remote Syslog

✔ Enabled

Aviatrix CoPilot Remote Syslog Profile

Server	[REDACTED]
Protocol	UDP
Port	5000

Edit Profile

- In the **CoPilot > Settings > Configuration > Logging Services** page, you can configure the forwarding of logs from the Aviatrix platform to the log servers of well known log management systems.

CoPilot NetFlow

- The NetFlow collector is by default the CoPilot.
 - ❑ When you deploy the CoPilot, automatically the Controller will open the port UDP **31283** (NetFlow) on the Security Group attached to the CoPilot instance.
 - ❑ All the Aviatrix Gateways will send NetFlow data to the CoPilot.
 - ❑ As a consequence, FlowIQ feature in Aviatrix CoPilot will start to process the NetFlow information received by the Gateways.

CoPilot Alerts Configuration

1. Webhooks Integrations work with any 3rd party integration (Slack, PagerDuty, ServiceNow, etc.)
2. Add webhook endpoints (can send payload as JSON or text)
3. Provide custom tags in the payload to classify triggered events and further integrate into your systems
4. Get alerted via webhook and email for the same alert

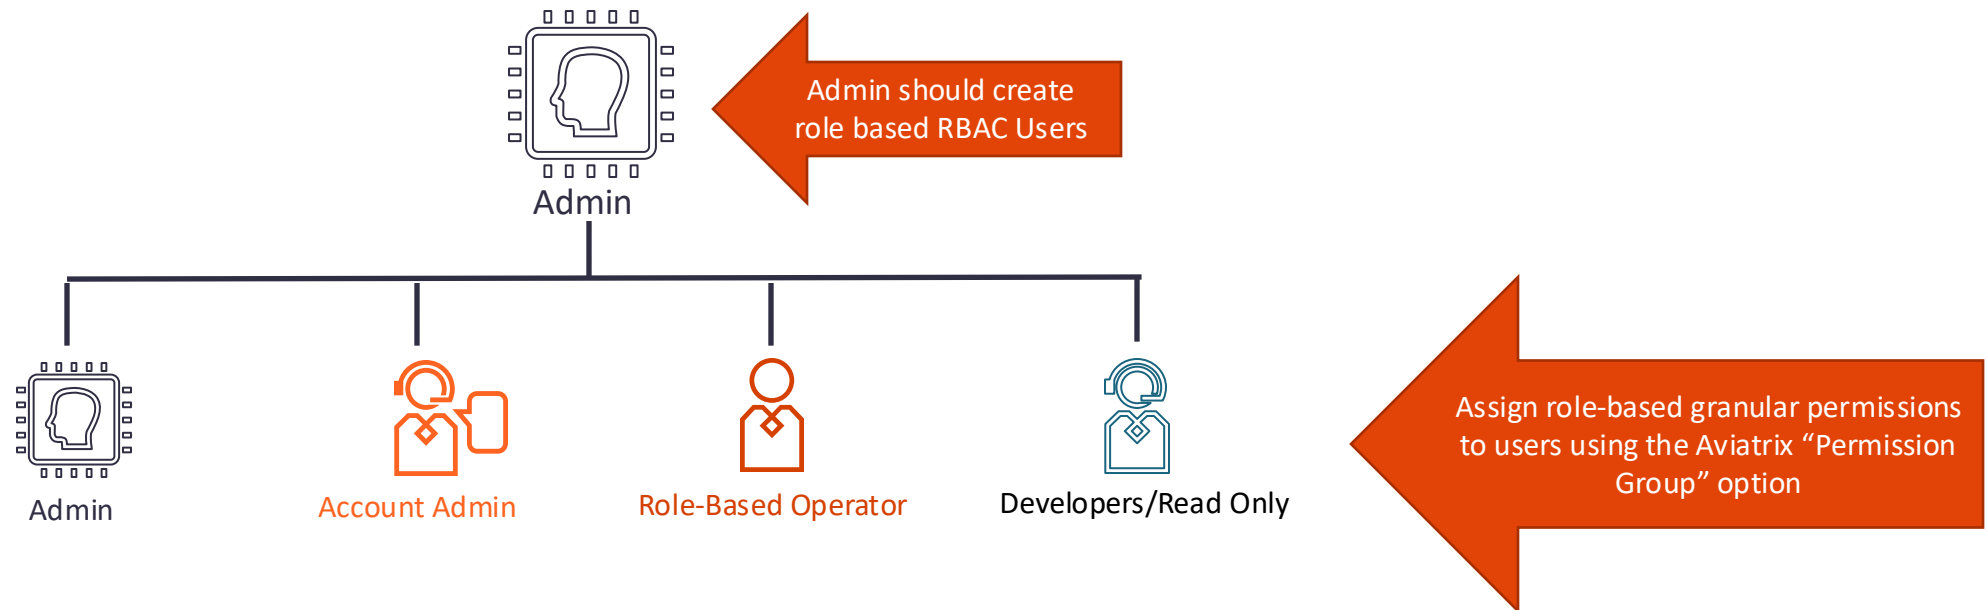

The screenshot displays the CoPilot Alerts Configuration interface. On the left, a dark sidebar contains a search bar and a list of navigation items: Dashboard, Cloud Fabric, Networking, Security, SmartGroups, Cloud Resources, Monitor (highlighted with a red box), FlowIQ, Performance, Traffic & Latencies, Notifications (highlighted with a red box), Diagnostics, Billing & Cost, Administration, and Settings. The main panel features a top navigation bar with tabs: Notifications, Alerts, Alerts Configuration (highlighted with a red box), System Messages, Tasks, Recipients, and Settings. Below the tabs, a '+ Alert Configuration' button is visible. The central area lists existing alerts: Global Control Plane Health, Global Network Health, and Global Memory Swap Surge. A 'Create Alert Configuration' modal is open, showing fields for Name, Monitor (Controller selected), Condition (CPU Idle (%)), Evaluation Period (5 min), and Send Alerts To (Recipients). The 'Save' button in the modal is highlighted with a red box.

Role-Based Access Control (RBAC)

RBAC: Role-Based Access Control

Aviatrix RBAC is based on the “Users” and “Permission Group” concept

RBAC with SAML/OKTA

Authentication Phase

- Users can be authenticated:
 - **Locally** on the Aviatrix Controller
 - Onboard Users (Admin, Operators, Developers, Read-Only)
 - Allowed to reset their password
 - Using **SAML IDP**
 - Onboard Users (Admin, Operators, Developers, Read-Only)
 - Other functionality depends on IDP

- Developers/Read Only Developer

Configuring SAML Authentication

User can be authenticated using the local database or using the SAML Integration.

Go to *CoPilot > Administration > User Access > Access Management*

Under Login Authentication, click **+SAML Endpoint**

The screenshot shows the CoPilot Administration console. On the left sidebar, the 'User Access' menu item is highlighted with a red box. In the main content area, the 'Access Management' tab is selected. Under the 'Login Authentication' section, the '+ SAML Endpoint' button is highlighted with a red box and a red arrow pointing to it. Below this, a table lists existing SAML endpoints, with the first entry 'aviatrix_saml_sso' showing its configuration details.

Aviatrix Controller High Availability (HA)

Aviatrix Controller High Availability (HA)

- Very important: Controller is not in the data path
- If Controller is down → Data Plane still functions
- Your cloud network is still up and running
- Do not compare on-prem to cloud
 - Hardware devices cannot be replaced / software is more flexible
 - Cloud operating models are different
 - Cloud processes are different
 - We need a fresh and different look to solve

Aviatrix Controller HA Process

- Takes minutes to switch over to new controller
 - Depends on factors such as AWS latency, instance type, size of the DB, etc.
- Previous controller is terminated
- All existing configuration is restored
- New Private IP is assigned (new AZ)
- New controller stays at the same version as previous

https://docs.aviatrix.com/HowTos/controller_ha.html

<https://github.com/AviatrixSystems/Controller-HA-for-AWS/>

Aviatrix Controller HA Process

- Aviatrix Controller HA operates by relying on an AWS Auto Scaling Group
- The Auto Scaling Group has a desired capacity of 1
- If the Controller EC2 instance is stopped or terminated, it will be automatically re-deployed by the Auto Scaling Group
- An AWS Lambda script is notified via SNS when new instances are launched by the Auto Scaling Group
- This script handles configuration restore using the most recent Controller backup file, stored in S3

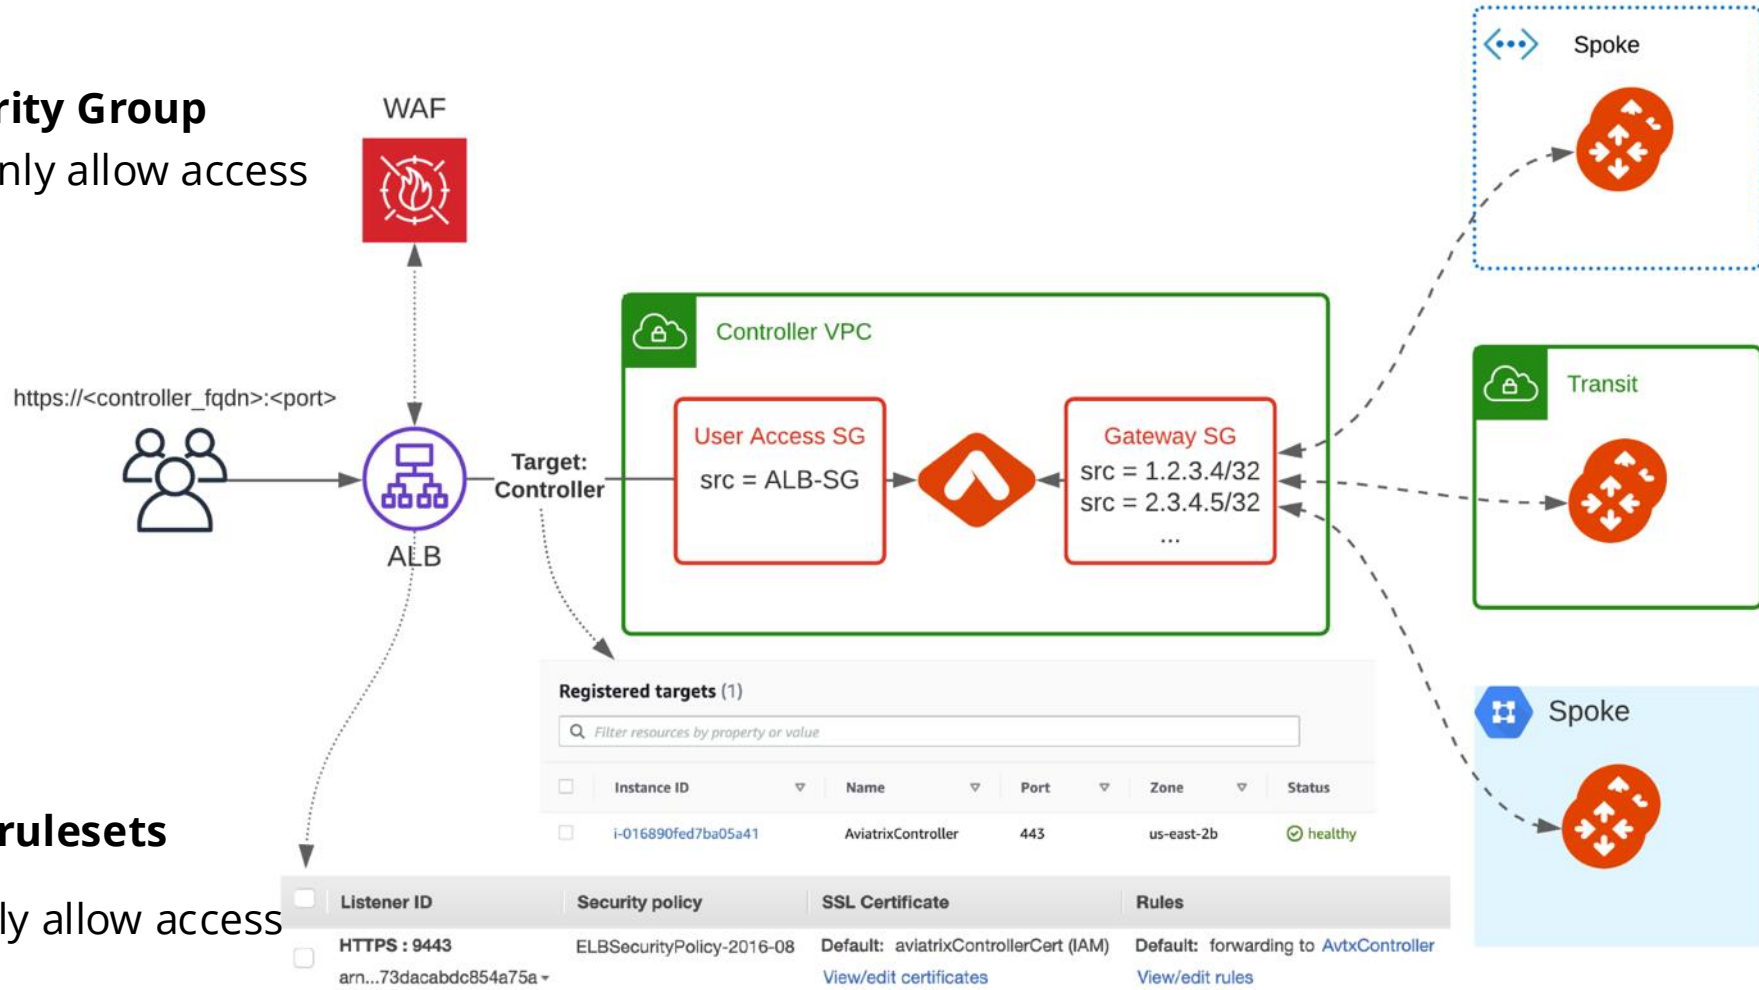

Securing Aviatrix Controller with Application Load Balancer

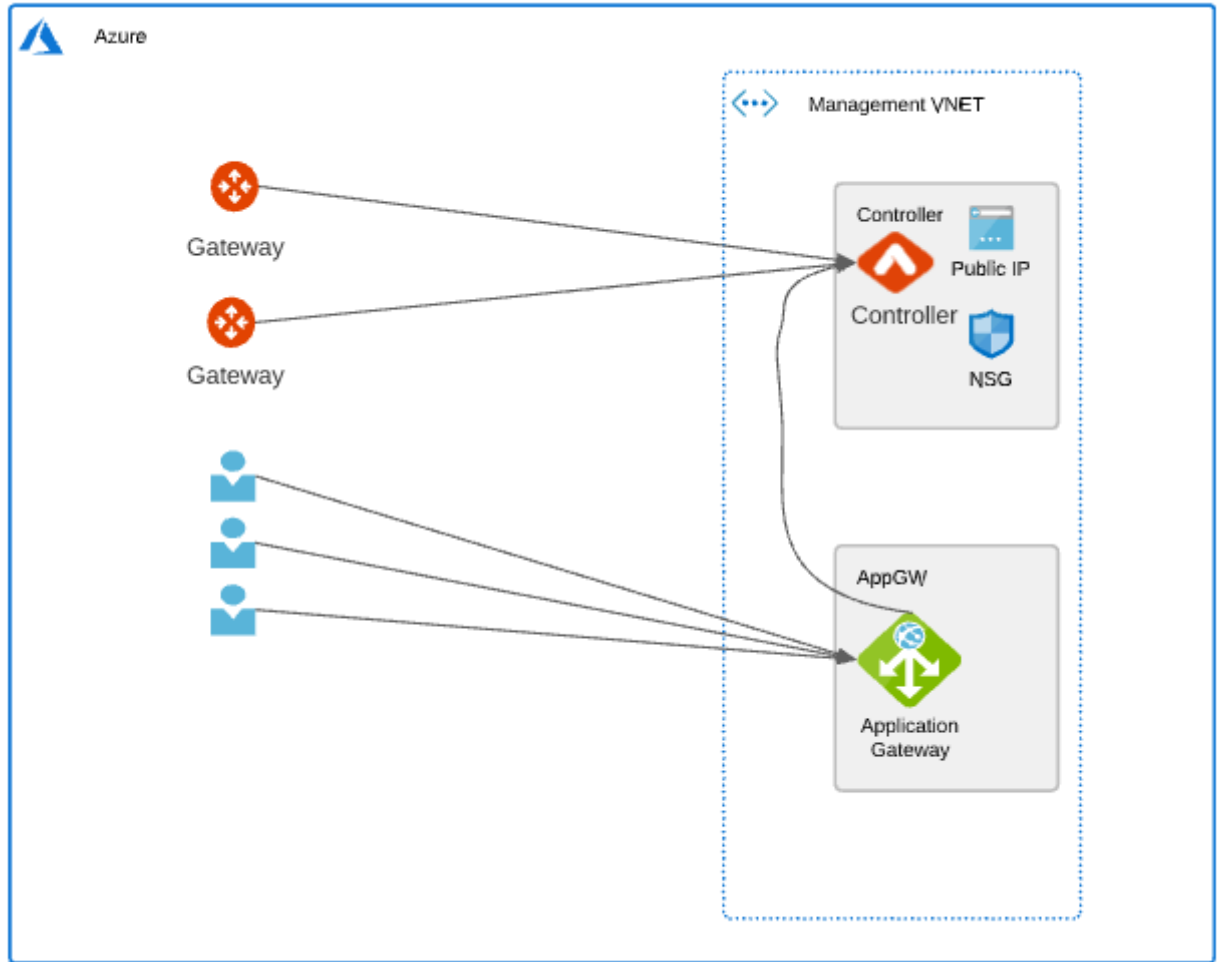

Applies to any cloud

- Confirm that the **Controller Security Group** Management is NOT disabled to only allow access to the Controller EIP from Aviatrix Gateways
- Create a new internet facing **ALB**
- Modify main **Controller Security Group** to only allow access from the ALB Security Group
- Enable **WAF** on the ALB with AWS Managed Rules
- Adjust ALB **idle timeout, modify rulesets**
- Modify **ALB Security Group** to only allow access from the admin user IP

- Use WAF with Azure Managed rules on Application Gateway to limit usual web hacks/attacks against Controller
- Only allow user access from the Application Gateway subnet to Controller on port 443 (Controller Security Groups management feature is a pre-requisite for gateway communication to Controller)
- Allow configuring user access on non-standard HTTPS listener port
- Terminate SSL connection on Application Gateway to leverage cloud native certificate management and WAF capability to inspect and log requests
- L7 health-check on the Controller

Gateway and Controller Sizing

Controller Sizing

- Controller uses multiple cores to handle the API query load generated by CoPilot → **Minimum 4 core instance**
- Resizing:
 - If you do not use User VPN
 - ❑ Stopping the controller to resize does not impact the data traffic
 - ❑ Always good practice to backup controller before performing upgrade
 - If you use User VPN
 - ❑ No impact to connected users, but new connections could not be established during the stop and resize
- Maintenance Windows for resizing usually do not require more than 15 minutes

Gateway Sizing

- Gateway selection affects expected throughput
- If you decide to enable **High Performance Encryption**
 - Use Jumbo MTU and to verify MTU along the path
 - Go to TROUBLESHOOT > Diagnostics > Network
 - Select a gateway and destination IP address, click **Trace Path**
 - It will display MTU of the devices along the path
- **Secure Egress**
 - T2.micro is not adequate, for instance
 - But test it out and adjust accordingly based on CSP quotas*
 - *CSPs have quotas on PPS, but often do not publish them

Gateway and Controller Upgrading & Updating

Types of Upgrades and Updates

- Software Upgrade

- Replaces relevant Platform (i.e., Controller) and **selected** Gateway packages, configuration files, and binaries to Target version
- Part of regular maintenance operations
- Hitless

- Image Upgrade

- Replaces **selected** Gateway cloud image (AMI, VHD, etc.) to the newer version
- Doesn't change Aviatrix software version
- Less frequent
- Incurs traffic disruption

- Security Patches

- Released when security updates to underlying software components become available.
- Most security patches are hitless (review the release notes)

- Software Patches

- Released to address compatibility issues when they arise (if you are using any applications or configurations affected by the patch.
- Most software patches are hitless (review the release notes)

Terminology

- Software Major, Minor, Build Release
 - Numbering convention
 - Example: AviaTriX Release 6.5.100

Supported Upgrade Paths

- Upgrading Builds (within same minor release)

- You automatically get the latest build and cannot select the build number.
- Process might skip over previously released build numbers.

- Upgrading Minor Release Version (within same major release)

- You must upgrade each minor release sequentially.

- Upgrading Major Release Version

- You must upgrade each major release sequentially.

Software Rollback

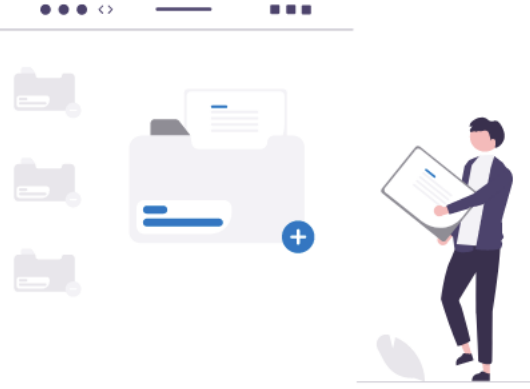

- Software roll back to Gateway software previous version
- Previous version may or may not be the latest patch/build version available
- Replaces the entire Gateway (image + software) → expect brief disruption
- Gateway Image version may automatically be downgraded if required
- Does not apply to Controller

Upgrade Scenarios

- At any point in time, the Controller supports 2 unique Gateway software versions :
 - **Target Version:** same version as the Controller
 - **Previous:** previous version of the Controller
- Example of supported scenario
 - Upgrade the Controller from 6.5 to 6.5.100
 - Upgrade a group of Gateways to 6.5.100
 - Remaining Gateways run 6.5
- Example of unsupported scenario
 - Upgrade the Controller from 6.5 to 6.5.100
 - Upgrade a group of Gateways to 6.5.100
 - Remaining Gateways run 6.5
 - **Upgrade the Controller to 6.5.200**
 - **Not supported: All Gateways must be upgraded to 6.5.100 before upgrading the Controller to 6.5.200**

Upgrade Groups (1)

- ❑ Each Upgrade Group that gets created is split up into two groups:
 - **Primary Node Group**
 - **Secondary Nodes Group**
- ❑ If you do want to get around that you will have to, after you have created the group, to manually update it to include additional ones. Likewise, If you want to do both primary and Secondary nodes at the same time.

Upgrade Plan and Upgrade Groups

You can now create Upgrade Groups of Gateways based on Cloud, Account, Region, or other criteria.

Each Upgrade Group will be automatically divided into two subgroups: one comprising High Availability (HA) instances and another comprising Primary instances.

Reorder the groups based on your preference to create your Upgrade Plan. Applicable for both Software and Image Upgrades.

☒ Software Upgrade

Gateway software upgrades replace the relevant gateway packages, configuration files, and binaries without disrupting network traffic or replacing the gateways. All software upgrades are hitless.

☐ Image Upgrade

Aviatrix periodically releases new gateway images that include updates, enhancements, and security improvements. A best practice is to plan to upgrade your gateways at least once a quarter.
